Version Control

Version	Date of change	Details of changes
2.0.12	October 2010	Published version used for migrating clients
2.1	June 2011	Updated specifications including Secure Transfer details
3.1	April 2024	Major updates

Glossary

Term or abbreviation	Meaning
CommBiz UI	CommBiz User Interface via CommBiz.com.au
ERP	Enterprise Resource Planning. This software manages internal and external resources such as financials and HR. Examples include SAP, JDEdwards, SAGE and Microsoft Dynamics amongst many others.
LAN	A local area network (LAN) supplies network capability (e.g. internet, email) to a group of computers within close proximity, such as an office building or school
PGP	PGP is a data encryption and decryption standard. PGP is used to encrypt or digitally sign files (e.g. email, text files).
PKI (Public Key Infrastructure)	A system that uses digital certificates from certificate authorities that verify and authenticate the validity of each party in an internet transaction.
SFTP (Secure File Transfer Protocol)	SFTP uses SSH to transfer files and encrypts both data and commands thus preventing passwords and information from being transmitted in human readable format over the network.
SSH	Secure Shell enables data to be exchanged between two networks via a secure channel. SSH operates on port 22 and ensures that the communication channel is secure

1. Introduction

CommBiz Automated is CommBank's client integration and file transfer solution. It allows clients to connect directly with the Bank through their Enterprise Resource Planning (ERP) software to exchange payment instructions and account information and allow straight through processing for a client's business banking needs.

To assist in the planning and management of your onboarding for CommBiz Automated, the Bank will provide support through your Relationship Team and a dedicated Implementation Manager as well as documentation to assist with your onboarding.

Below you will find detailed technical requirements, which your information technology team will be able to use in the provisioning of your new CommBiz Automated solution. This service will automate and streamline the transfer of your data files to and from the bank using industry standard secure file transfer software and appliances.

A glossary has been provided in Appendix 2 to assist with technical terminology that is used in this document.

If you have any questions around these requirements or the engagement process, please contact your Relationship Team or Implementation Manager.

2. Information you need to send to the Bank

2.1 CommBiz Setup

CommBiz Service: CommBiz is the Bank's online Business Banking channel. As part of this Implementation, we will need to establish your business with CommBiz access. If you already have CommBiz, your existing service can be used. If you do not have CommBiz, please speak to your Relationship Team to help facilitate your CommBiz setup.

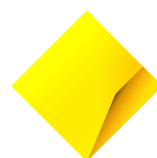

CommBiz Automated Registration Form: We require you to complete the CommBiz Automated Registration form to authorise the establishment of CommBiz Automated. This form also outlines the CommBiz service, the Automated User, the ERP being connected, and the Payables and Receivables information coming through the CommBiz Automated channel.

Please review this form, confirm that the information is correct and that you would like us to proceed to set up your facility.

2.2 Automated Connection

The Automated User: The Bank will create an "Automated User" in CommBiz. This "Automated User" will need to be linked to an identified user on your CommBiz Service. This will be completed by the Bank as part of the implementation process.

Public/Private Keys: Using secure file transfer protocol (SFTP) requires the use of PKI public/private key pairs. To connect to the Bank, you will need to generate and then provide the Bank with your public key. Technical details of this process are included in Section 2 of this document and may be used by your IT department.

PGP Key (Optional): For further file security, you may wish to digitally encrypt your files using PGP. Your IT department will have to provide your PGP public key to the Bank so we can encrypt the files you receive from the Bank. The Bank will provide you with its PGP public key so you can encrypt the files sent to the Bank.

3. Client CommBiz Automated Connection Testing

3.1 Connectivity Testing

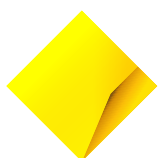

Your automated facility will be placed in a “pilot” environment to allow you to initiate connectivity testing. Connectivity testing will be performed by sending files from your SFTP Server to this environment. Your Implementation Manager will help facilitate this transaction by providing your IT department with your “Client Logon” and with further technical details as outlined in Section 2. Once we have confirmed that testing is successful, we will move your facility from the pilot environment to the production environment.

3.2 CommBiz File Testing

You will be setup in Manual Authorisation mode to help you facilitate your file testing. In Manual Authorisation mode, files will need to be manually approved or rejected. Once you are happy with your testing, the Bank can move your setup into Automated Authorisation mode (i.e. Straight Through Processing).

It is recommended that you complete low value production file testing. This will be completed with the assistance of an Implementation Manager.

Once your low value testing is completed you are now ready to “go live”.

4. Bank Support

4.1 Implementation Managers

Your Implementation Manager will work with you throughout the setup process. Key tasks that they will be involved in will be:

- Planning for the Implementation
- CommBiz Service Configuration
- Providing advice on the steps you will need to follow to connect to the Bank.
- Connectivity testing
- CommBiz file acceptance testing
- Low Value Testing

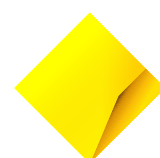

Your IT Team will be responsible for all scripting requirements and configuring your SFTP Client or Server.

4.2 CommBiz Helpdesk Support

Once your CommBiz Automated service is established, you can contact our CommBiz Support team via email at diamond@cba.com.au for any technical support going forward. Alternatively, the team can also be contacted on 13 23 39.

5. Business Continuity Planning (BCP) Considerations

- In an event where the connectivity with the bank is unavailable, you should revert to manual processing for file uploading and downloading via CommBiz UI.
- We strongly recommend that you create several users within CommBiz who have the permissions to import files, authorise payments. Please speak with your company CommBiz Administrator.
- You may want to consider building in an automated email notification to your system administrator so they can be made aware that manual processing will need to commence.
- If you are using PGP encryption you will need to remove the encryption from the file before you can manually upload into CommBiz UI.
- In the event of BCP for manual processing – Batch files via CommBiz UI has a maximum path length of 248 characters and maximum file name length of 182 characters.
- In the event of BCP for manual processing – Maximum file sizes for manually uploading payment files:
 - Direct Entry is 9.25 MB.
 - BPAY is 9.216 MB
 - FX is 9.215 MB

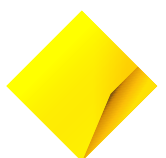

6. Technical Details

6.1 Hardware / Software Requirements

Requirement	Reason for use
SFTP Client or Server	An SFTP client or server is used to send or receive files to/from the Bank. SFTP is an open standard file transfer protocol that use PKI public/private keys for security. The client or server must be able to use Open SSH 2048-bit RSA public keys.
WAN and LAN Connectivity	All files will be transferred over the internet. The quicker your upload and download speeds, the more efficient the file delivery will be. The files saved on your file servers will need to be accessible within your Local Area Network (LAN) and must have the appropriate file permissions for the SFTP client or server to access them unattended.

6.2 Security and Communication Protocols

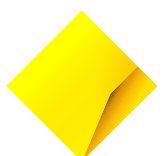

Requirement	Reason for use
CommBiz Automated Login ID (generated by the Bank)	Used as part of the SFTP client configuration to initiate the SFTP connection between you and the Bank.
Generation of an Open SSH public/private key pair (2048 bit RSA) (generated by you)	You will need to generate an Open SSH public/private key pair to secure your SFTP sessions. Your 2048-bit RSA Open SSH public key must be provided to the Bank via email.
Bank to verify the digital fingerprint of the public key provided by you	The Bank will confirm to you the fingerprint of the public key we receive, so you can verify that the key pair has originated from within your organisation.
Firewall changes	You may be required to add an outbound rule enabling your internal SFTP client or server through your firewall and outside your network to connect to the CommBank infrastructure over the internet. Connection details: IP Subnet: 140.168.0.0/16 TCP/IP Port: 22

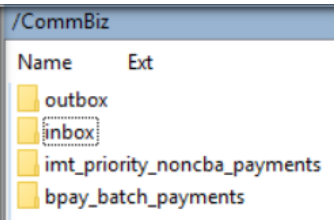

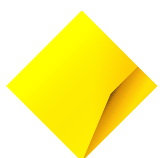

6.3 Connection to the Bank

To connect to the Bank the following activities will need to be undertaken by your technical team in the following order.

Activity	Reason / Details
Create an OpenSSH public/private key pair (2048-bit RSA)	You will need to create an SSH key pair. You will keep the Private key secure on your network and in your SFTP client software and provide the bank with the public key. Please email your SSH public key to your Implementations Manager for onboarding. Your key needs to be an OpenSSH compatible 2048-bit RSA key. Once we have this key, we will confirm receipt and verify authenticity. Post implementation, if you require replacement keys to be provided to the Bank, you can email the CommBiz Support team at diamond@cba.com.au
Establish a connection using your SFTP Client	You will need to create a new connection/site in your SFTP client or server software environment: • Site: securetransfer.commbank.com.au • Login ID: Provided to you by the Bank. <i>CommBiz Service ID preceded by 3 zeros (e.g., 000100002001)</i> • Load SSH Private key: load the Private key into the SFTP client or server (this varies according to the program used)
Ensure your file formats are compatible	• Existing standard legacy file formats will be supported. • Automated channel size limit - 100MB
Ensure your file names and file types meet the requirements	Please refer to Appendix 2 for the detailed file naming and file type requirements. • File name length max 173 characters. • Alphanumeric allowed. • Specific special characters allowed depends on Operating System. • WinZip/file compression is supported on the automated channel. • PGP also has compression capability.
Scripting your SFTP client or server connection	Scripting will be required to automate the connection to the Bank. Please refer to Appendix 1 for the flow charts that describe possible steps to be taken when scripting your solution.

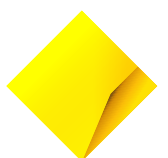

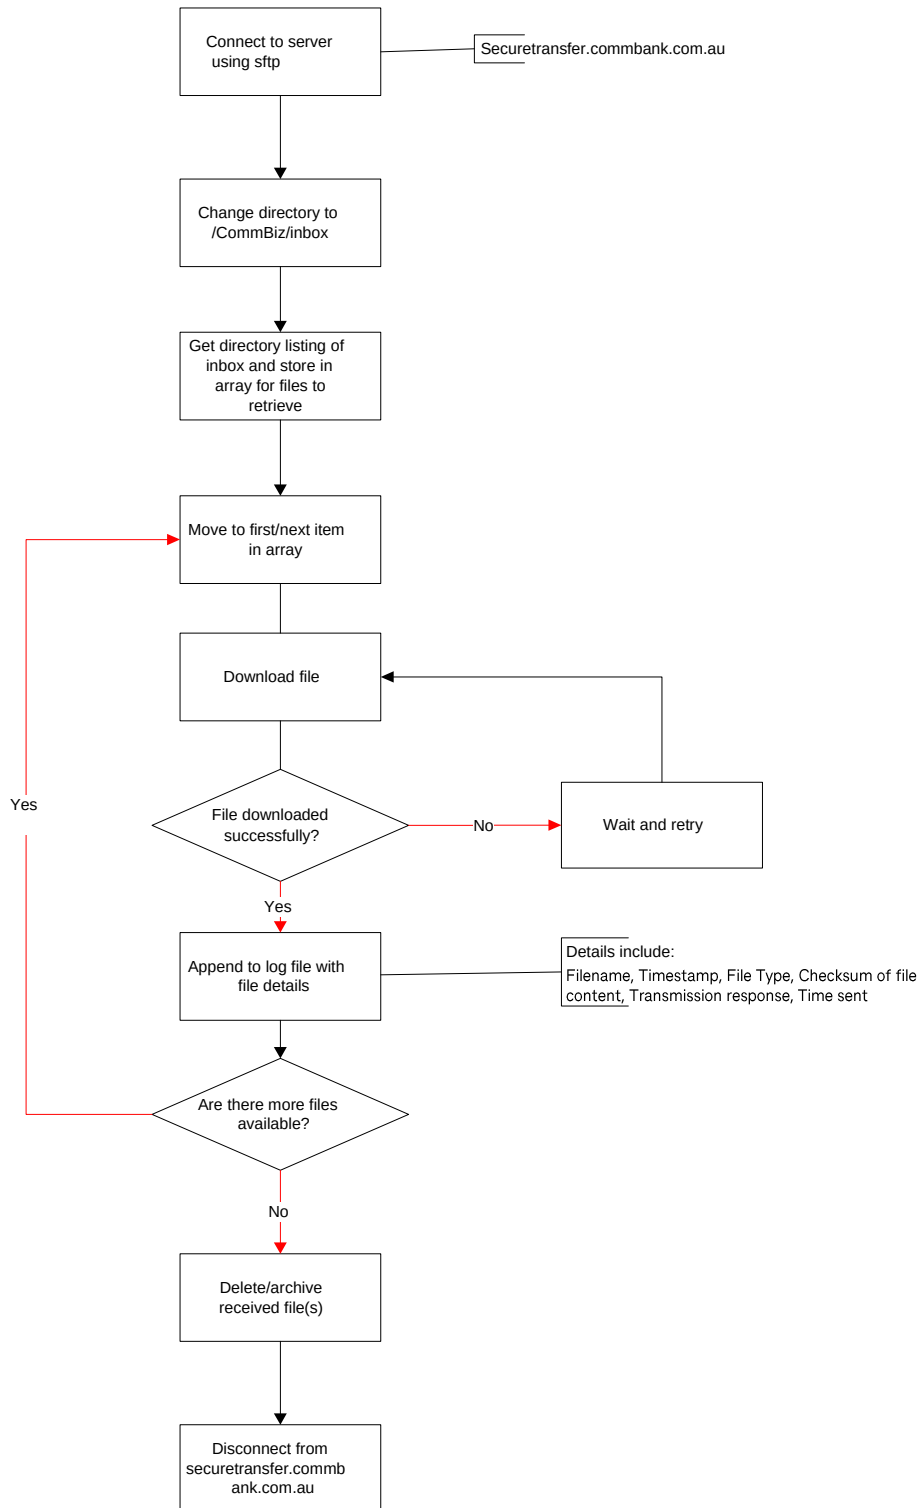

Activity	Reason / Details
Use of PGP encryption for additional security (optional)	PGP encryption can be used if you require increased security for delivering payment files to and/or retrieving receivables files from the Bank. To use PGP, we need to exchange PGP public keys. Key elements include: - You must create a PGP private / public key pair. - You keep the PGP Private Key on your SFTP client. - You provide the Bank a copy of your public key. - The Bank will generate a PGP key pair and send you the PGP public key. To encrypt files sent to you, the Bank will use your public key. To encrypt files sent to the Bank, you will need to use the Bank's public key.
Folder Structures 	Once connected you will see the following folder structures: /CommBiz/inbox this folder is used to collect files from the Bank (e.g. receivables, status files, BAI2/BTRS). It will be your responsibility to remove/archive files from this directory once they have been downloaded successfully. /CommBiz/outbox this folder is used to send files for processing by the bank. Files dropped in this folder will be moved to a processing area within The Bank. You will no longer have access to files delivered to this folder. /CommBiz/bpay_batch_payments folder is used to send BPAY Payment files to the bank. Files dropped in this folder will be moved to a processing area within the Bank. You will no longer have access to files delivered to this folder. /CommBiz/imt_priority_noncba_payments folder is used to send IMT, Priority Payment and NonCBA payment files to the bank. Files dropped in this folder will be moved to a processing area within the Bank. You will no longer have access to files delivered to this folder. This folder is enabled upon request. Note: The inbox, outbox, imt_priority_noncba_payments & bpay_batch_payments paths are case sensitive and need to be populated in code exactly as shown above.

Appendix 1 – Possible scripting flow charts

Downloading Receivables Files

Appendix 2 – File Naming and File Type Conventions

Acceptable filenames

For data files sent to the Bank, filenames must conform to: •

- Only alphanumeric (numbers and letters), or;
- '.' (dot) or;
- '_' (underscore);
- Filenames should not contain spaces;
- Maximum client filename size should conform to a maximum of 173 characters" (inclusive of the file extension).

Acceptable file Extensions:

If sending files via CommBiz Automated, then the following file extensions will fail and the file will be rejected:

- JPEG, BMP, PDF, DOCX, ZIP.
- If using CommBiz UI (Manual) to upload files and the file ends in ".zip", ".z" or ".gz" then it must be a compressed file.
- Irrespective of the upload method (Manual or Automated) CommBiz will reject the following file extensions:
- WMZ, HTM, XLSX
